

Bird Strikes – Is the risk increasing?

Prepared by Alan Moffat
Mount Cook Airline

A white Air New Zealand aircraft, a twin-engine turboprop, is shown in flight against a clear blue sky. The aircraft is banking slightly to the right. The text "AIR NEW ZEALAND" is visible on the side of the fuselage, along with the airline's logo. Below the fuselage, "Mount Cook Airline Ltd." is written. The aircraft is leaving a white wake behind it.

In this presentation I would like to:

- Look at some regional bird statistics and examine what level of risk that bird strikes pose.
- Look at some of the problems airports face in controlling birds.
- Highlight some areas airlines can improve to reduce bird strike risk.

A photograph of a white commercial airplane on a tarmac. A large, bloody bird carcass is hanging from the fuselage, illustrating the damage caused by bird strikes. The background shows a blue sky with some clouds.

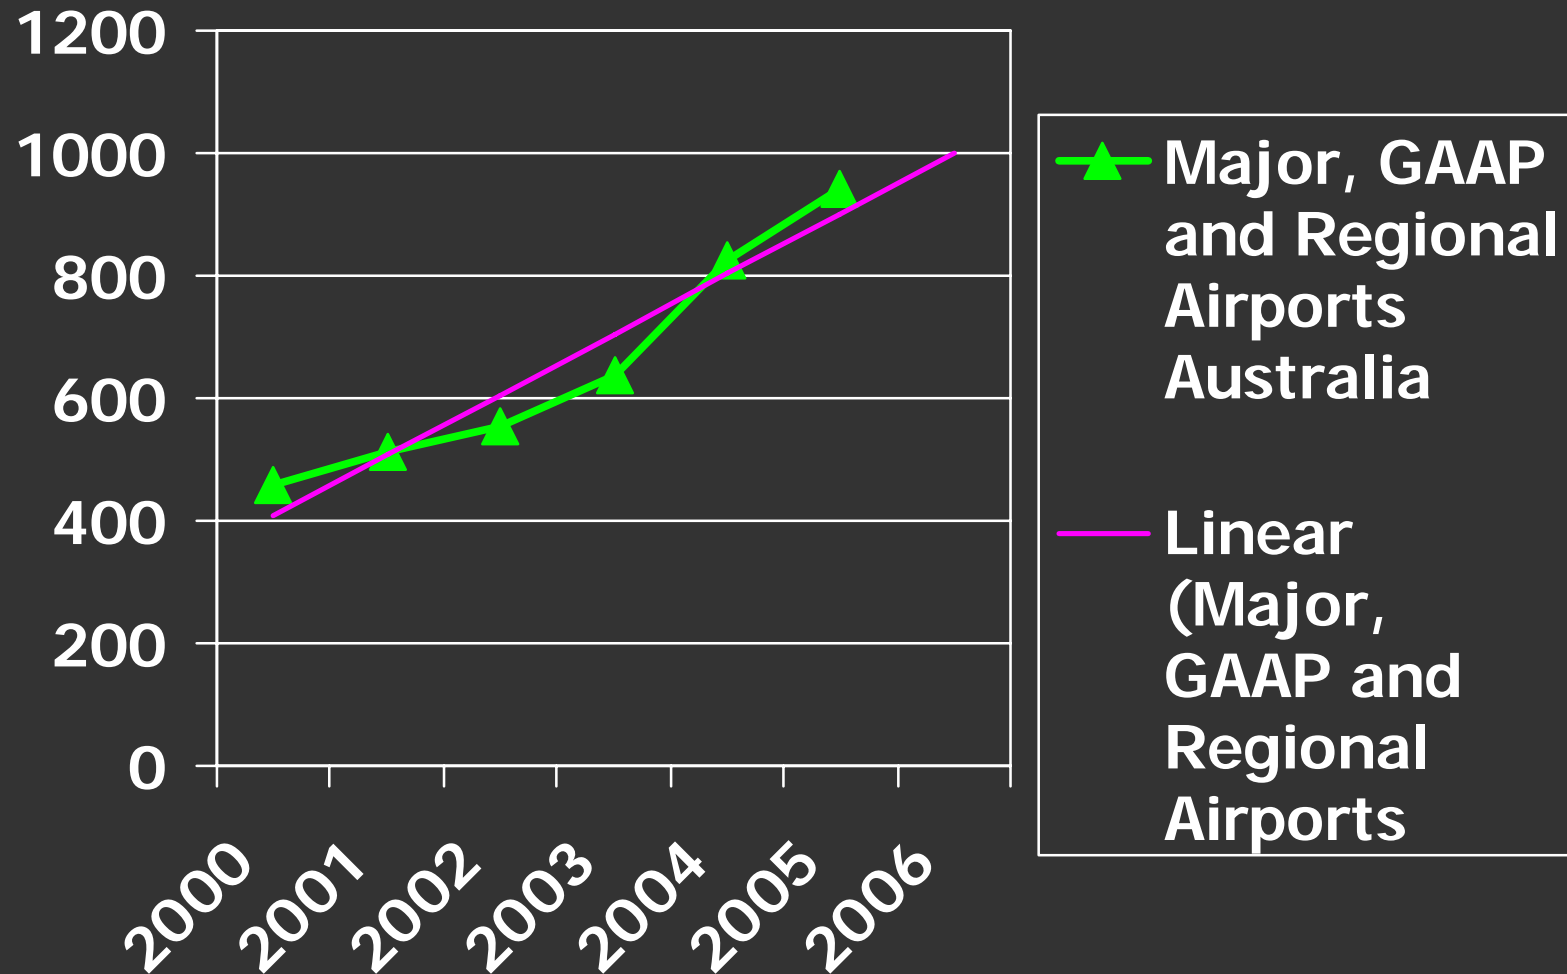

The available data suggests that there has been a significant increase in the rate of both total bird strikes and damage bird strikes recorded between 1991 and 2001.

ATSB Report 2002 'The Hazard posed to Aircraft by Birds'

Mount Cook Airline Bird Strikes and Near Miss Statistics

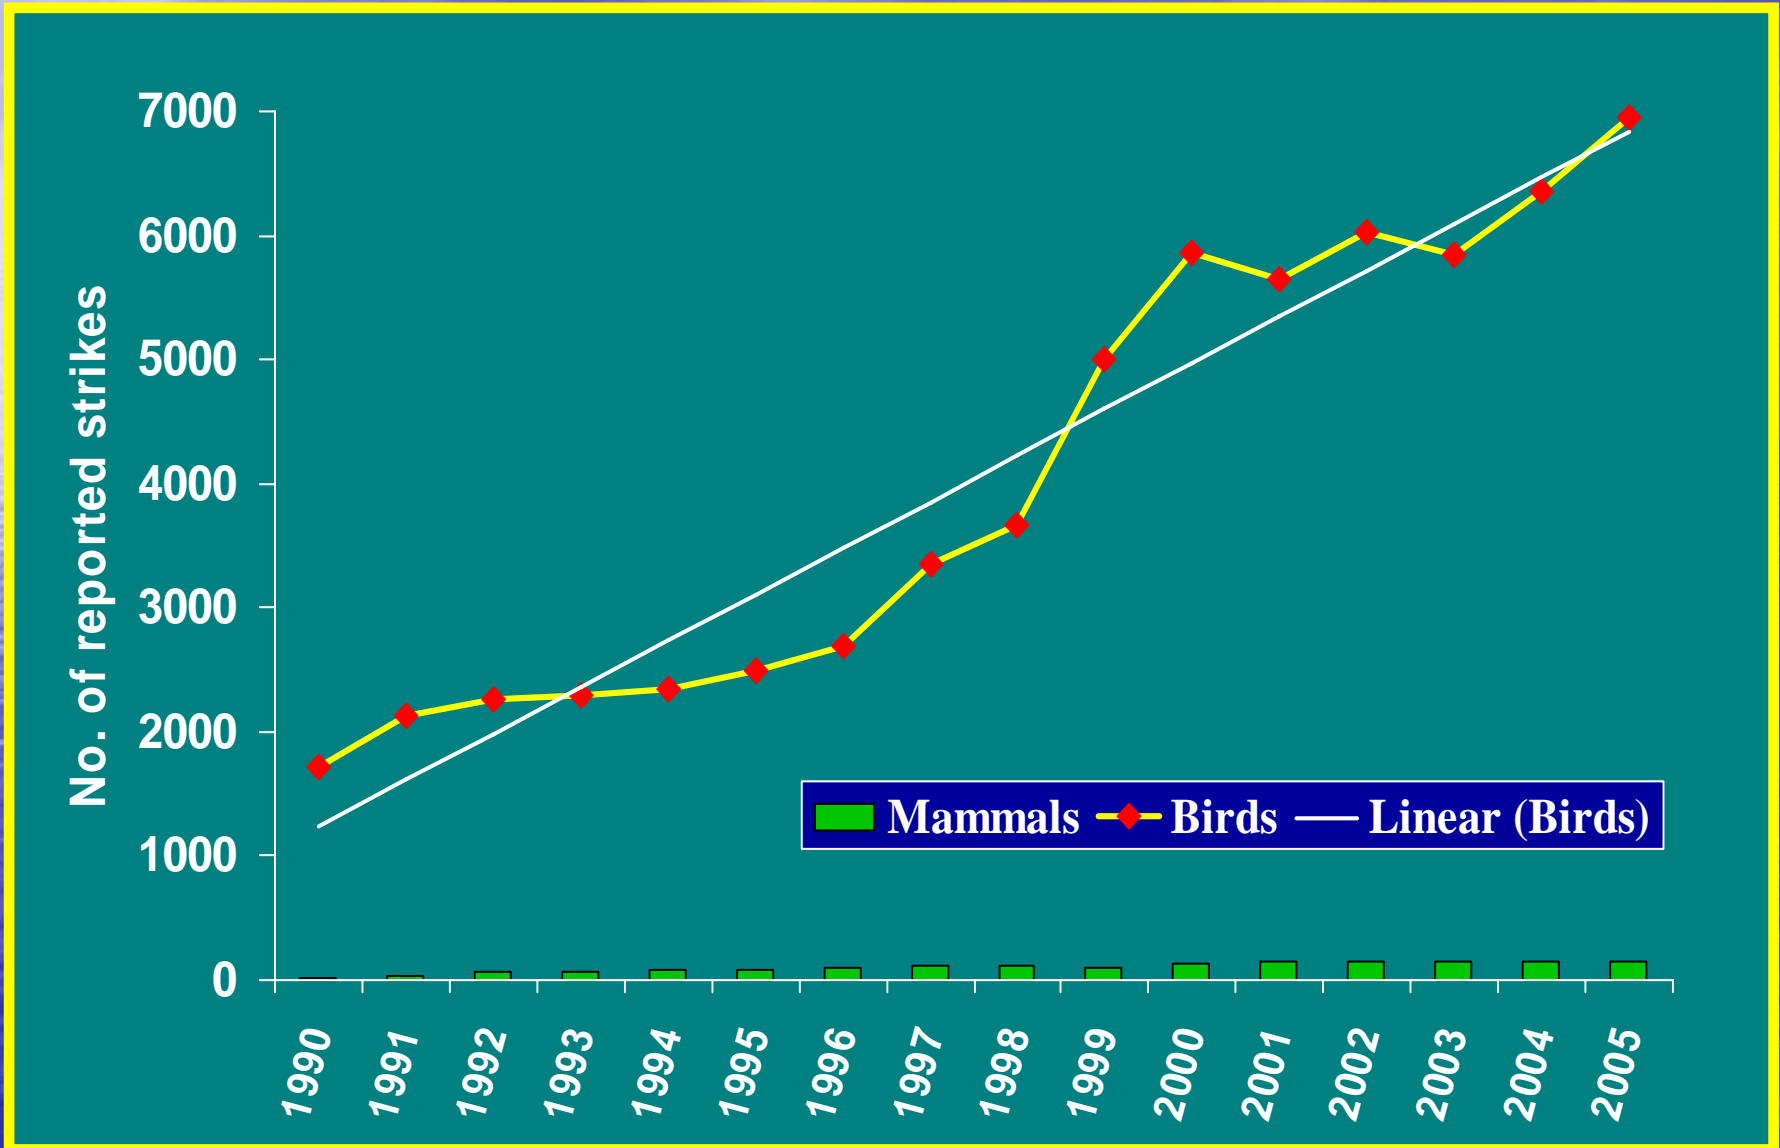

Australian Statistics – (from ATSB)

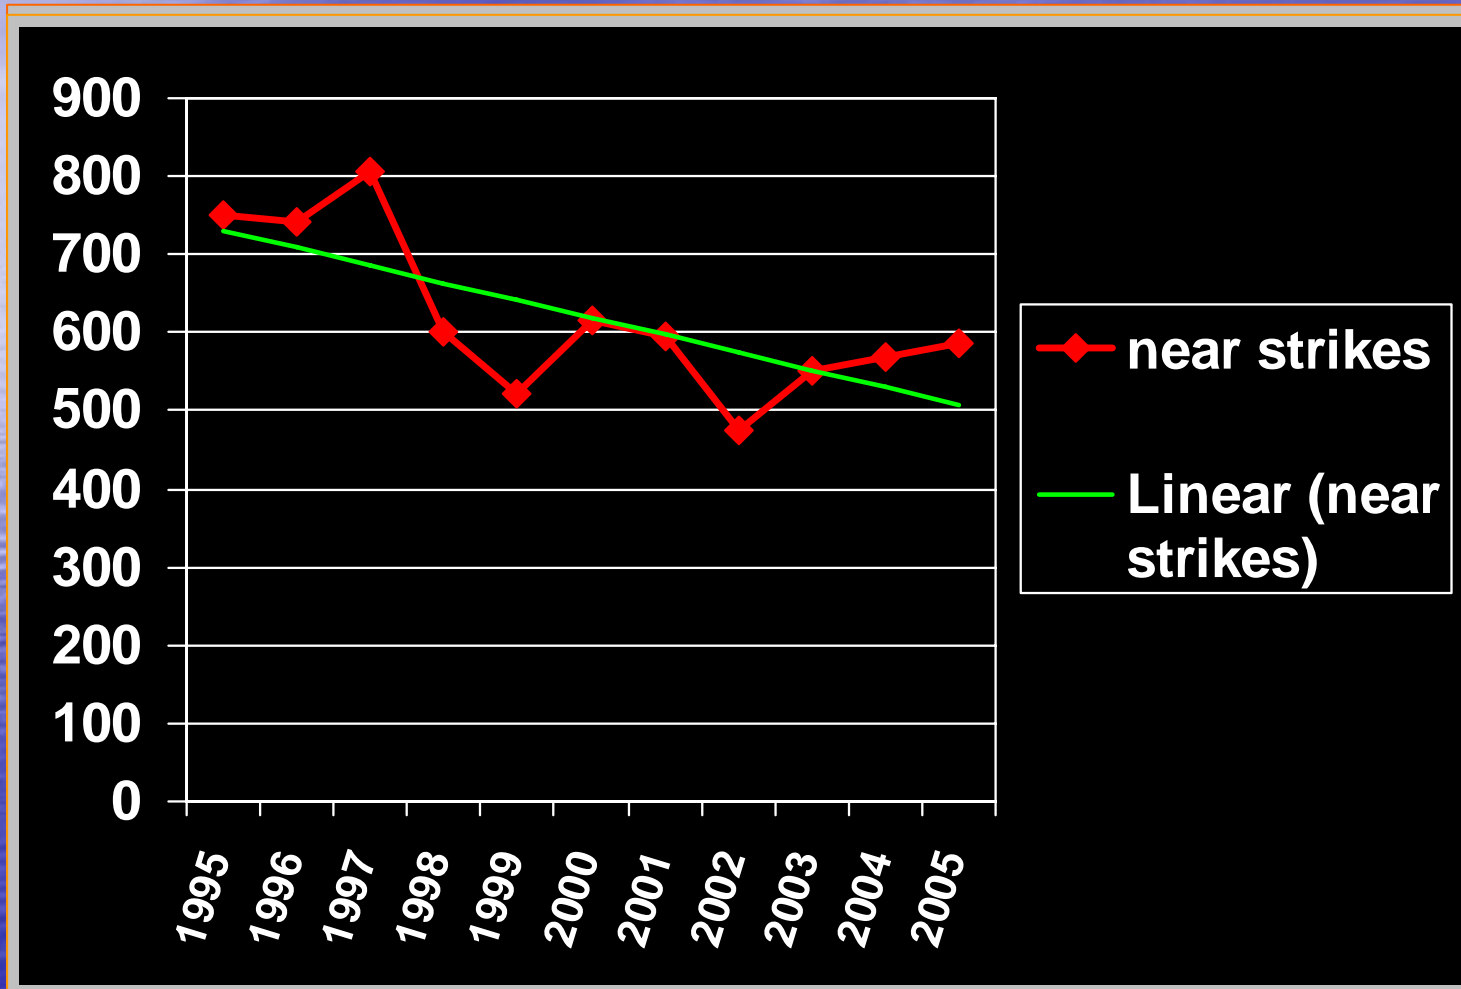

Reported Wildlife Strikes with Civil Aircraft in USA Tripled, 1990-2004

Source – US Fish and Wildlife Service

NZ Strike/Near Miss Statistics – Source NZCAA

Three Representative Species

- Large – Canadian Goose, impact forces at 250 knots up to 38 Tonnes.
- Medium – Cormorant, impact forces at 250 knots 5 – 20 Tonnes
- Small – Starling, impact forces at 250 knots up to 2.5 Tonnes

Impact forces taken from ATSB Report

 UK Canadian Goose Population

Report on Large
Flocking Birds

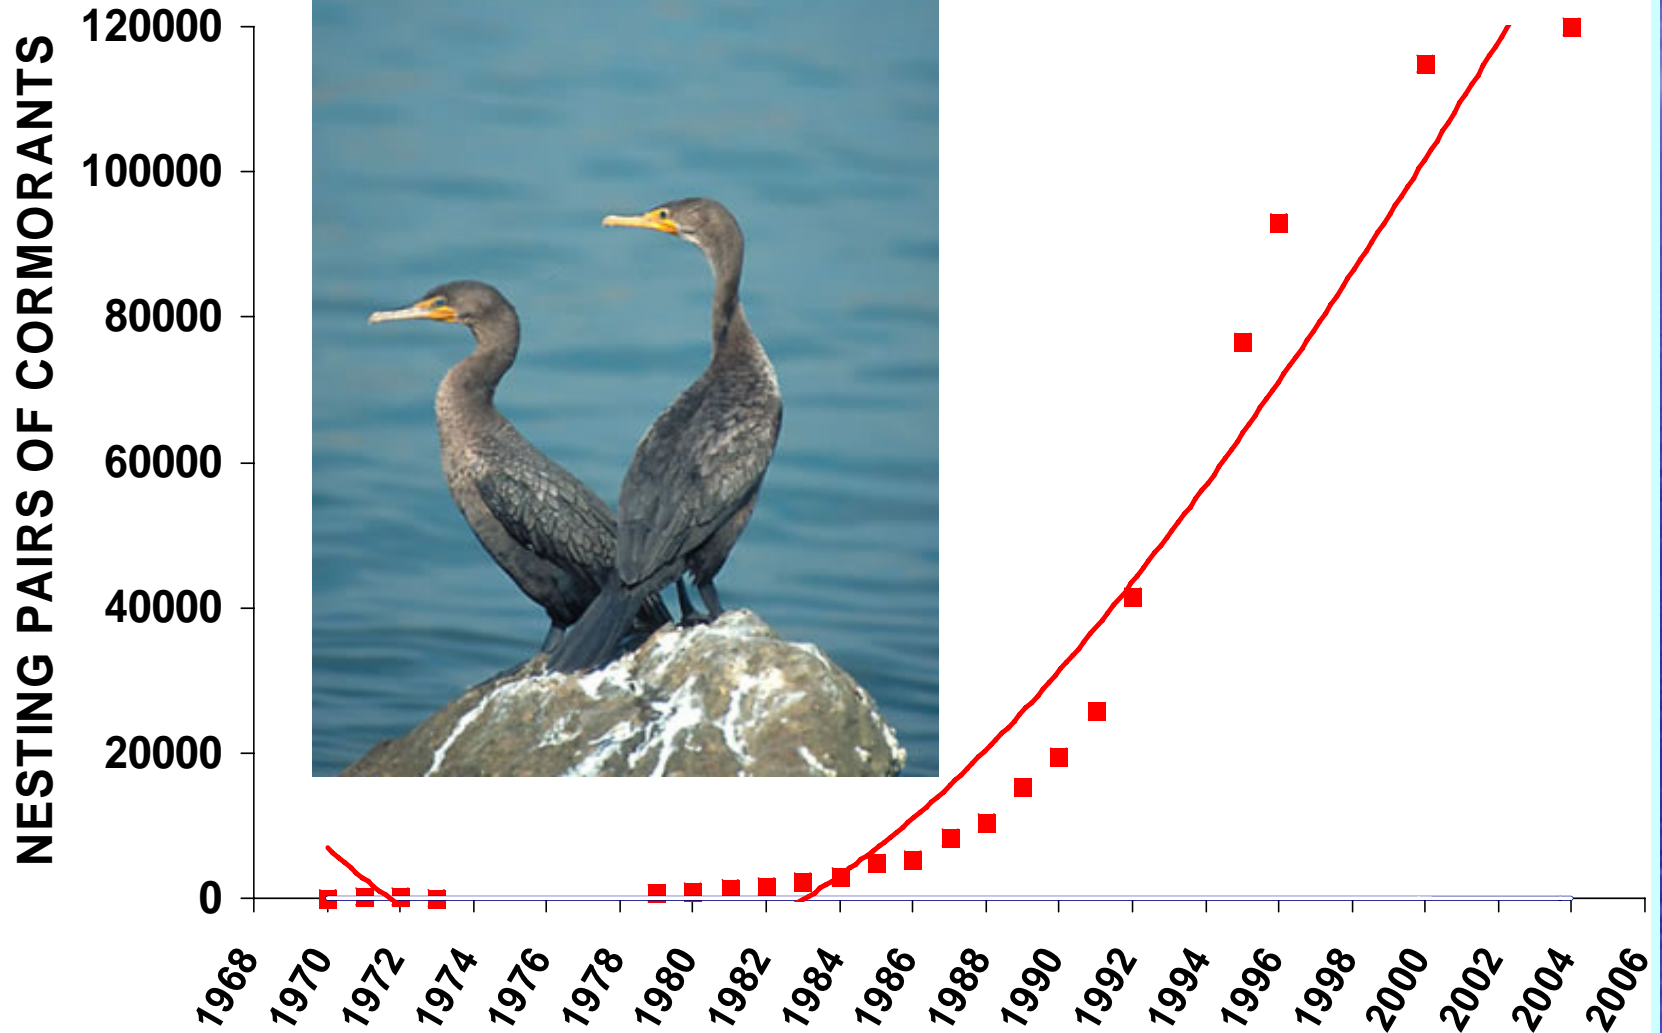

Boeing 727 engine after ingesting a Canadian Goose, April 2000

A320 engine totally destroyed after ingesting a Canadian Goose

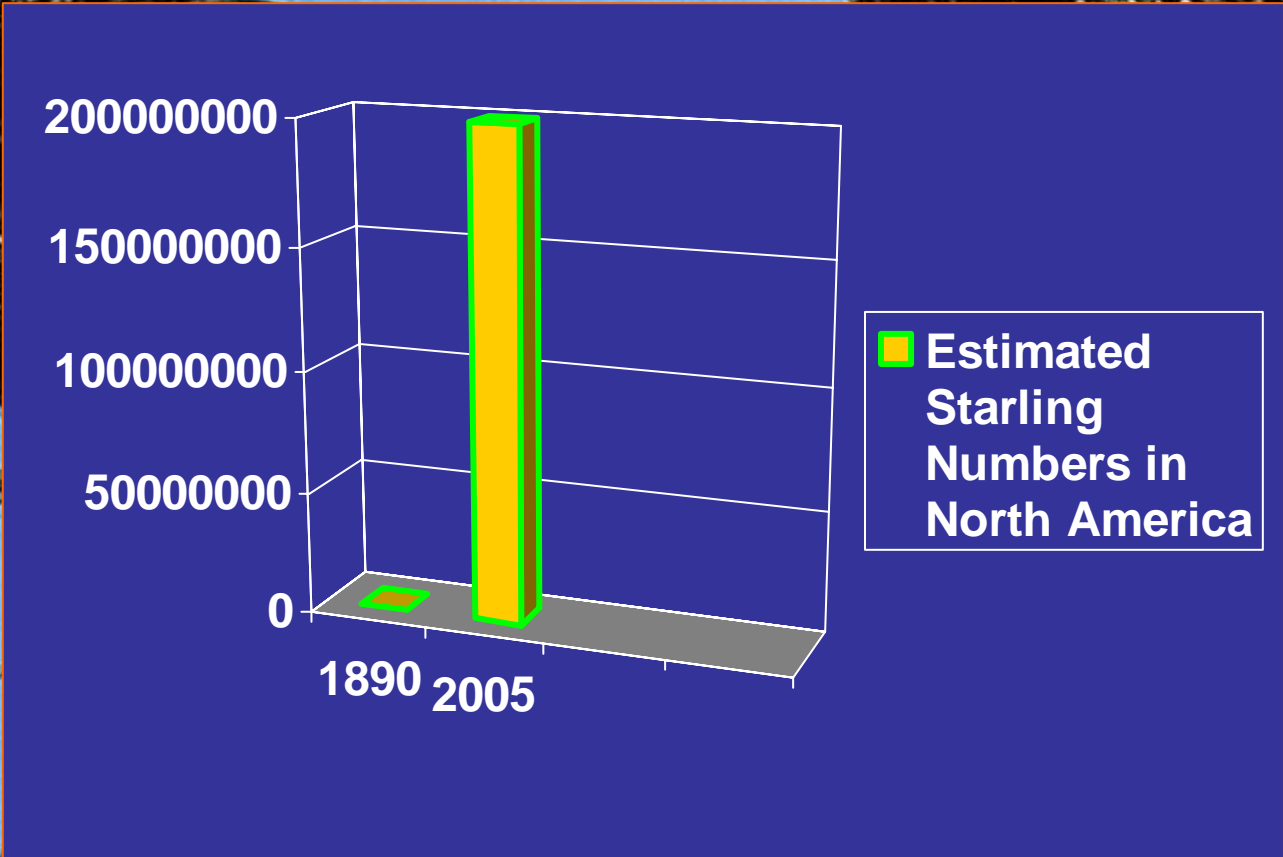

BREEDING POPULATION OF CORMORANTS INCREASED OVER 1000-FOLD ON THE GREAT LAKES, 1972-2004

MD80 engine after ingesting a 5lb Cormorant

Starling population ('Feathered Bullet')

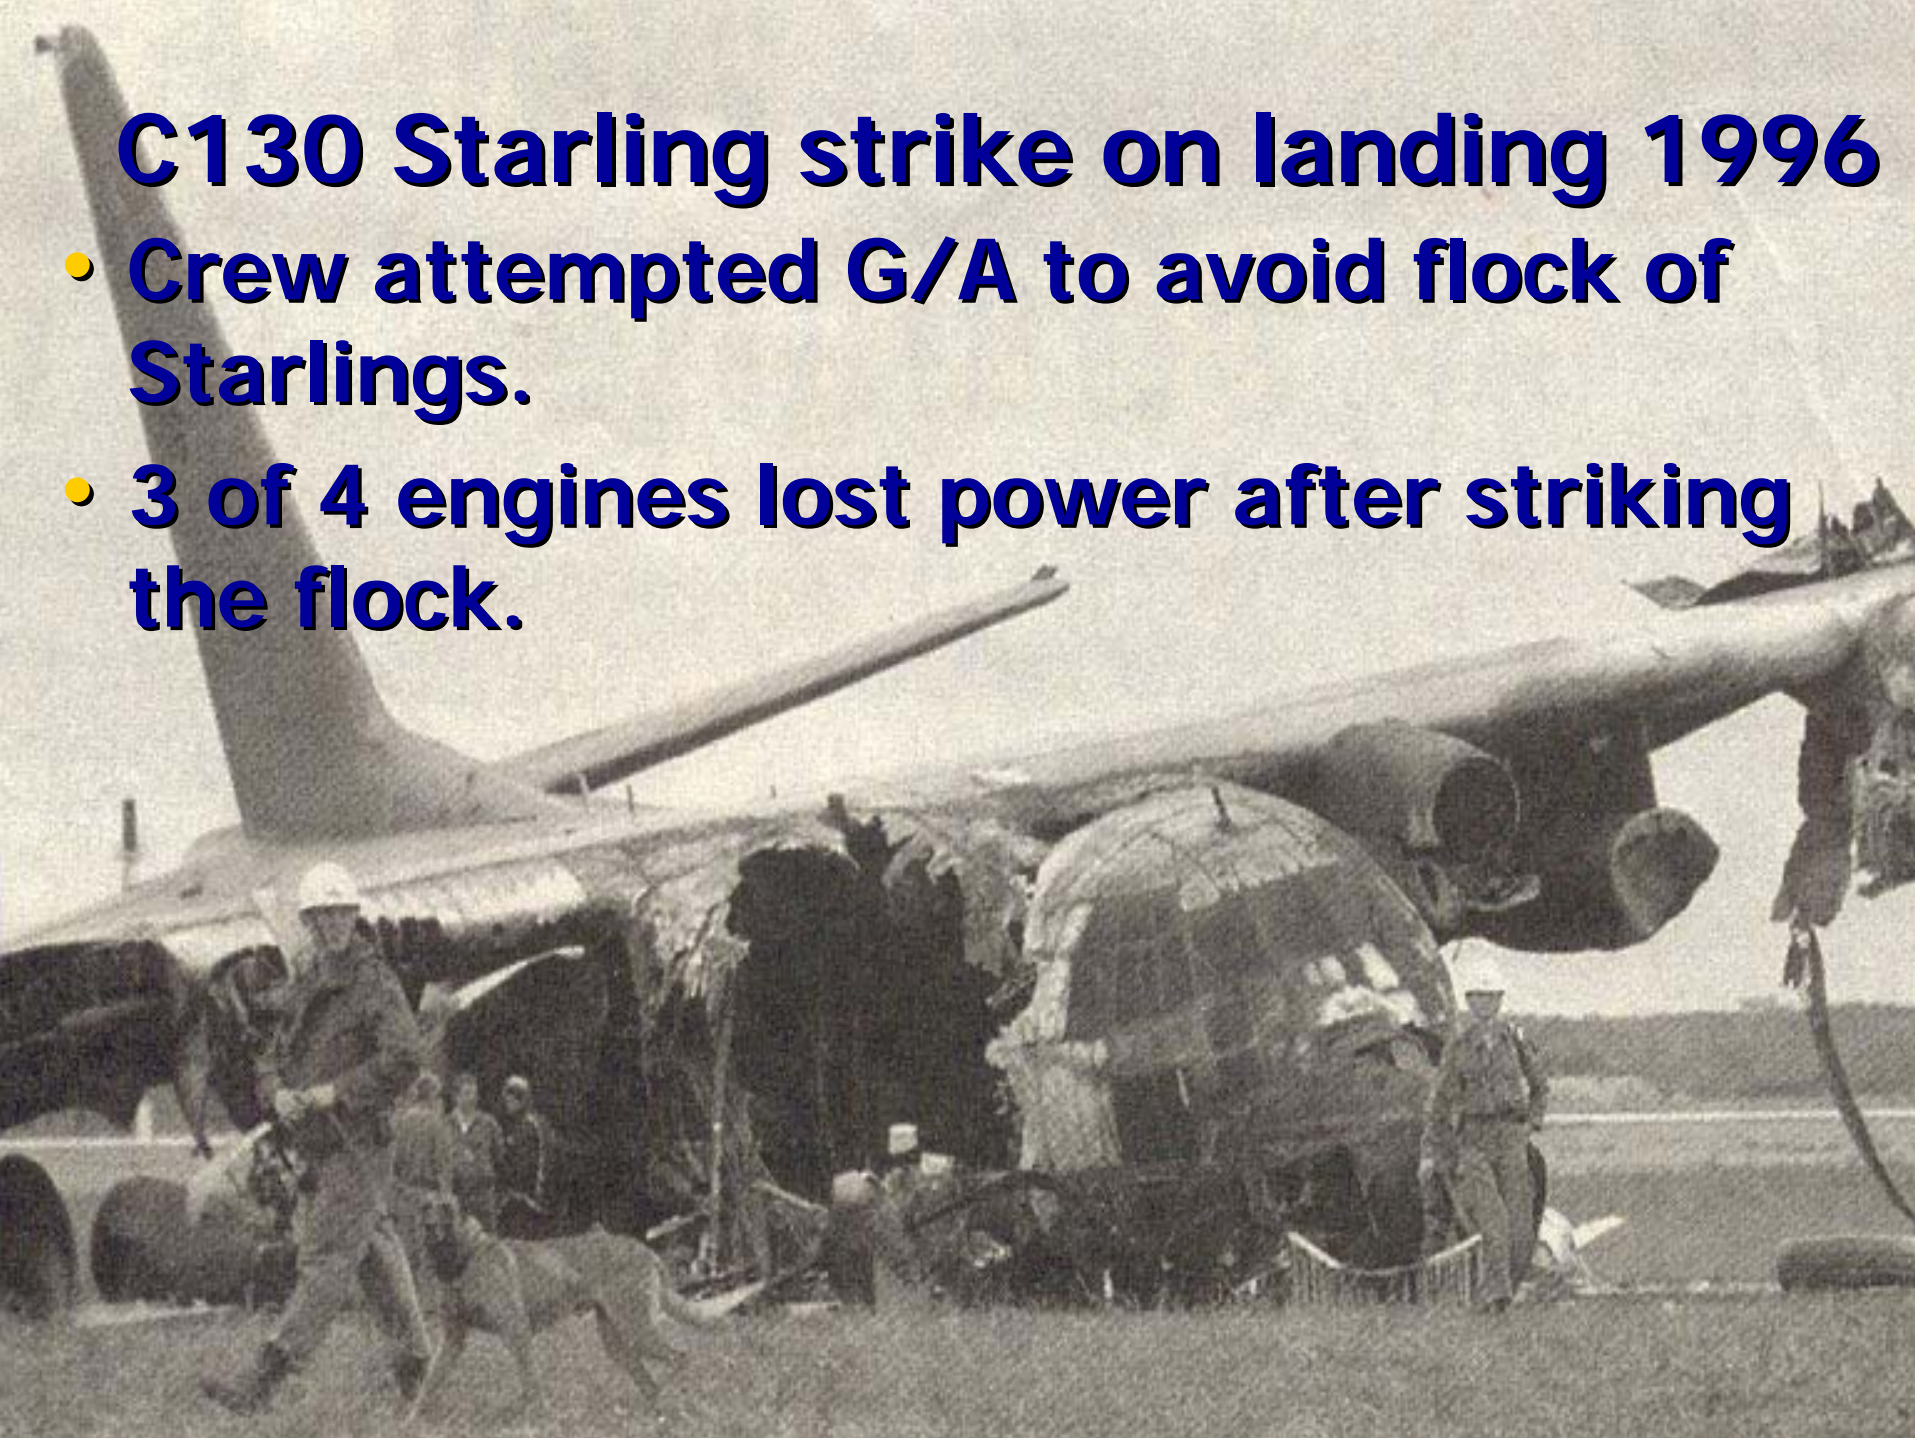

- Starling flocks can contain thousands of individual birds.

C130 Starling strike on landing 1996

- **Crew attempted G/A to avoid flock of Starlings.**
- **3 of 4 engines lost power after striking the flock.**

What are the Risks Associated with a Bird Strike ???? Safety risk

Probability of a large commercial aircraft accident caused by a bird strike is steadily increasing.

Financial risk

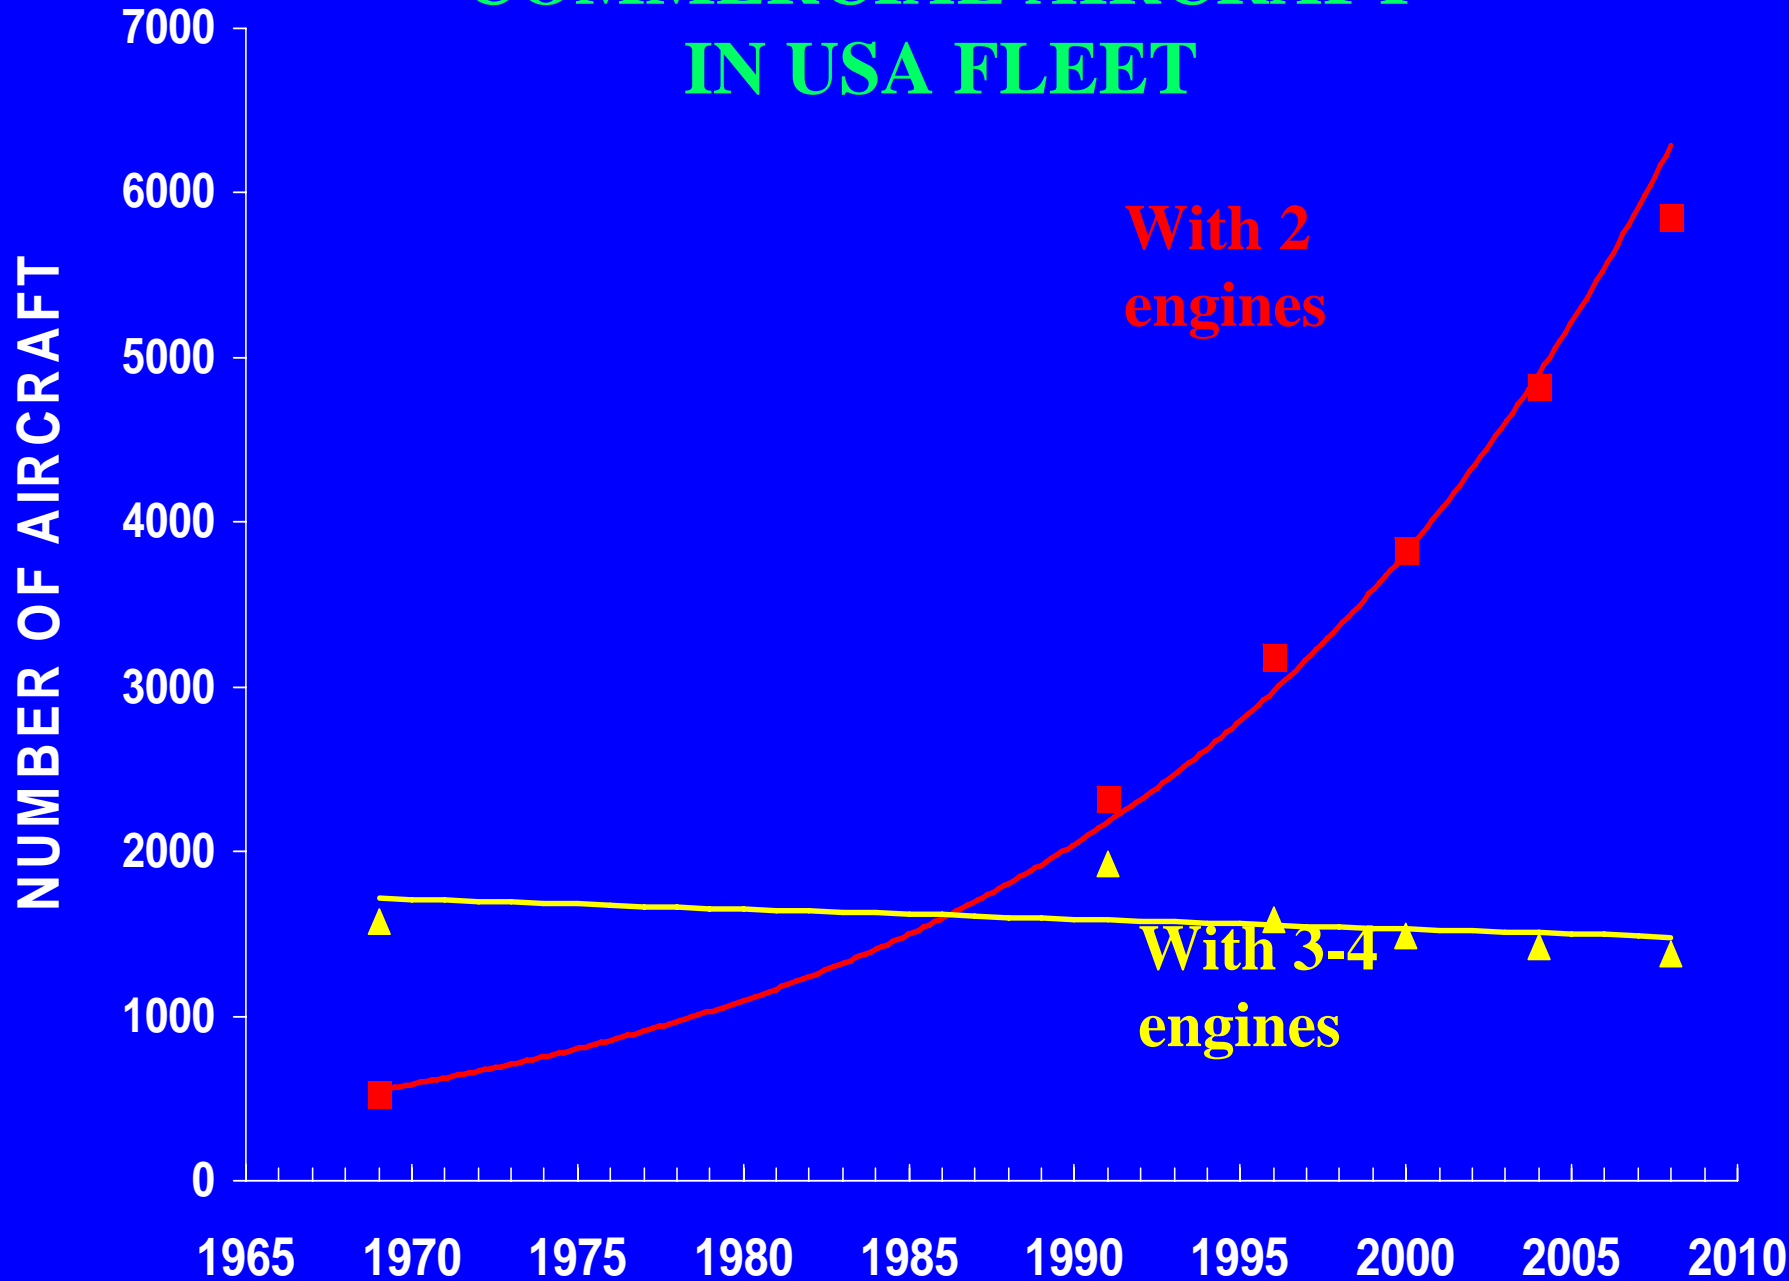

1. Direct – Cost to fix damage, parts and labour (costs to change one Trent N1 blade = \$73,000 USD approx).
2. Indirect – Aircraft downtime, passenger disruption. Usually exceeds direct costs by a factor of four (indirect costs to change one Trent N1 blade = \$292,000 USD, total \$365,000 USD).
3. Ancillary – Airlines Insurance, Airports Liability insurance, costs of bird control.

USA 1990 -2003

- 293 multi engine strikes occurred in this period.
- In 63 cases twin engine aircraft suffered damage to both engines.

Source – FAA database

COMMERCIAL AIRCRAFT IN USA FLEET

- Boeing 747 bird strike, Christchurch, 1985
- Flight operating CHC to Mel, 82 tones under MTOW.

- Passing V1 the flight struck 3 birds on the runway.

- At Vr a strong vibration begins.

- At Vlof compressor stall engine nr 3 begins, flames visible from cabin.

- Passing 600ft engine nr 3 reduced to Flight Idle (remains at FI for remainder of flight).
- Passing 900ft engine nr 1 shut down, due max level vibration.
- 2 engine ILS carried out after fuel dumping.

- Some of the damage.

- An engineering analysis determined birds had been ingested into engines 1, 2, and 3.
- No major damage was caused to engine 2.

**The culprit, Pied Oyster
Catcher, weight 500 gm**

Large Bird - Strike / Ingestion Testing

- Most airframe components are designed to withstand a 4lb bird impact.
- Most existing engines are certified to “safe shutdown” after a single 4lb bird impact at 200 knots.
- Large modern engines are certified to “safe shut down” after a single 8lb bird impact at 200 knots (PW4084, Trent, GE-90).

Some Birds larger than 8lbs are increasing in number

- **13 of the 14 species larger than 8lb in USA have shown substantial increases in the last 20-40 years.**
- **Forces produced when striking these large species can exceed the design certification of an aircrafts engines or airframe.**

Are Airports doing enough to control Wildlife??

Bird-strike fears lead to culling

Blair Crean

Two thousand Canada geese were to have their heads chopped off in Christchurch overnight, leaving game shooters livid at a lost opportunity.

A cull of the birds on the Avon-Heathcote Estuary was expected to take place at full tide about 3.30am.

Fish and Game North Canterbury was to carry out the cull on behalf of the Christchurch City Council, at the urging of Christchurch International Airport Ltd over concerns the geese posed a bird-strike threat to aircraft.

Swift estimated more than 2000 Canada geese were living on the estuary.

He said the cull would likely account for nearly all of them.

Game shooters were angry that they were not being given the opportunity to shoot the birds.

Shooters paid their licence fees to Fish and Game, and resented the money being used to reduce their quarry.

Club past-president Warren Philpott said the loss of 2000 Canada geese from Canterbury's population

Ministry of Agriculture and Forestry and was within its guidelines.

Aitken said the community had raised concerns about Canada geese spoiling fields and public parks.

Christchurch's population of Canada geese was over 3500. This was more than twice the number advised in Fish and Game's management plan.

He said the cull had been approved by the SPCA, and would be supported by veterinarians.

However, a spokesman for

The Have's and Have Nots

An aerial photograph of a mountain range, likely Mount Cook, showing a large snowfield and a river valley. Two orange callout boxes with white text and arrows point to specific locations on the map. The top box points to a location near the top of the mountain range, and the bottom box points to a location in the valley below. The background is a high-resolution aerial image showing terrain, vegetation, and snow.

Christchurch International Airport
Average 37% of total Mount Cook
movements, 14% of strikes and near
misses

Invercargill Regional Aerodrome
Average 8% of total Mount Cook
movements, 24% of strikes and
near misses

What can Airlines do to help reduce risk??

- Procedures and Training for staff.
- Participate in Bird Safety groups.
- Reporting – encourage.

Procedures

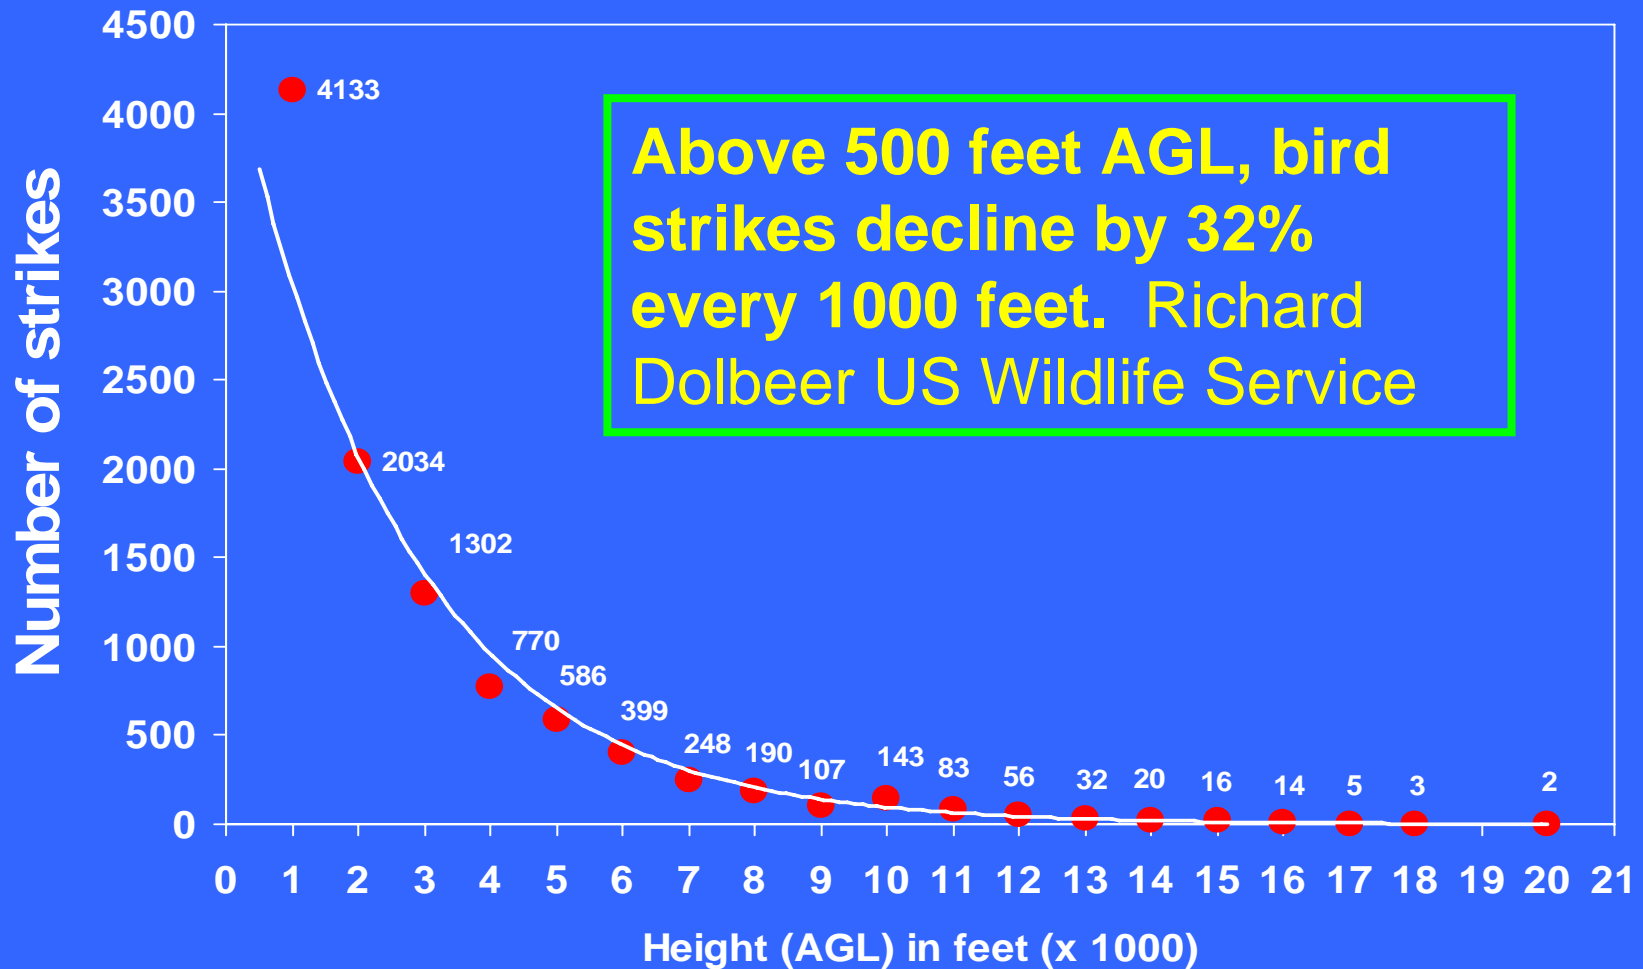

- Respect bird threat when taking off and landing.
- Speed for low level flight ($\frac{1}{2}MV^2$).
- Time spent at low level when a bird risk exists.

Training Ideas - Emphasise

- Importance of speed ($\frac{1}{2}MV^2$).
- Forces involved in bird strike.
- How fragile aircraft are.
- Bird Zone (90% of strikes at low level).

Number of strikes by 1000-ft intervals (501-20,500 ft AGL) (civil aircraft, USA, 1990-2004)

Video of actual bird strike (available on internet).

- Taken through HUD of Air Force Hawk trainer.
- Speed at time of impact 250 knots.
- Watch very carefully in the first 5 seconds for the Gull.
